Cache Directory Tool For Forefront TMG

Display the contents of the cache for all the Web pages stored in the Microsoft Forefront Threat Management Gateway cache. How to use this tool: You can run CacheDir.exe from any command prompt in any directory on the computer, or you can run it from a Windows Explorer window. When you start CacheDir.exe, the following screen appears: You can click OK to continue or CANCEL to quit the CacheDir.exe program. You can also start CacheDir.exe again to display more details on the contents of the cache. In the following table, you can see some of the possible command line options that are available. These options are valid if you have not yet started the CacheDir.exe program. You can start the program again and add the new options by clicking the OK button in the following screen. CANCEL to quit. GET to open a file that lists the contents of the cache. ASK to ask you whether you want to open a GET file or do the GET operation for a Web page. The following table describes the properties that are displayed for each Web page stored in the cache. Important If you modify the cache, you should modify the GET cache file. You can use the same GET cache file to access Web pages at different times. File Format The file that CacheDir.exe displays is an ASCII text file. The File and Contents tab of this file lists the properties of the Web pages stored in the cache. The Web pages stored in the cache are encoded using the UTF-8 character set. Any of the entries in the File and Contents tab of the GET cache file are a cache entry. You can find a description of each cache entry in the following table. Description URL contains the URL of the Web page. Flags specifies the flags for the Web page, as follows: 01 - The Web page is in the cache and ready to serve. 10

What's New in the Cache Directory Tool For Forefront TMG?

CacheDir.exe shows the contents of the cache in a list similar to the cache manager on the Forefront TMG Server. You can view the number of Web pages that are stored in the cache at any time. If you view the cache directory at the same time that your TMG server is performing a Web site scan, you will be able to identify Web pages that might be missed in a scan that might be missed in a scan. You can create a file that lists the Web pages currently in the cache at a particular time. Actions: If you want to use CacheDir.exe to view the contents of the cache, then you need to enter the directory that you want to be the root of the cache. (The Default cache directory is %SystemDrive%\Program Files\Forefront TMG\Caches). View: Get a list of all the Web pages currently stored in the cache. You can identify Web pages that are not included in a scan for a Web site. New: In order to create a list of all the Web pages in the cache, you need to provide a name for the file. For example, you might name the file CacheList.txt. Modify: You can modify the file that you create with a new list of Web pages by adding or deleting Web pages to the list. Once you have this data, you can use it to get your own list of Web pages that are stored in the cache for your site. Then you can apply these Web pages to your Web sites. Web Pages: The list of Web pages includes the name of each Web page, the last time that the page was visited, the last time that the page was accessed by any client, the URL of the Web page, and the date and time that the page was stored in the cache. For example, the output of the command that you use to list the contents of the cache might look like the following: cache_directory /show /caches Displaying the contents of the cache -----
To display the contents of the cache, you can use CacheDir.exe as shown in the following example: cache_directory /show /caches A request for a particular Web page will be served from the cache if the file exists in the cache directory. The cache directory does not refresh the cache contents when you have Internet Explorer set to cache the Web pages. This means that if you have not refreshed the cache directory for your site, any new files that you add to the cache will be included in the cache and will not appear in the cache directory until you refresh the

System Requirements For Cache Directory Tool For Forefront TMG:

Download and install NVIDIA® PhysX™ SDK for your platform. Go to the directory where PhysX SDK for the platform was installed. For example, on Linux, if you installed PhysX SDK for Linux using distribution specific method, it will be something like: `cd /opt/NVIDIA/PhysX-2.0.1/PhysX-2.0.1/Binaries` Download the software from the location that you have downloaded the SDK to, for example, 'WIN32' or 'Linux'.
